### Wiring Diagram

### **Power Supply Connections**

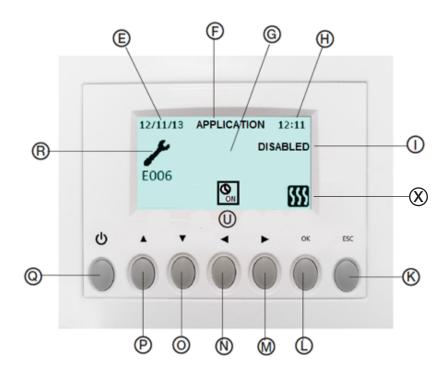

### **Sensor Connection**

### Display Functions

#### **CTRL-DSP Display**

E	DATE: shows the current date
F	APPLICATION: shows the current application
G	MODE: Shows auto fan [all modes except manual]
	or manual position
н	TIME: shows the time
- 1	Remote Enable: shows remote enable is disabled
K	ESC key: to exit and go back to the previous menu
L	OK key: to enter the selected menu
M	To go to the RIGHT in menus
N	To go to the LEFT in menus
0	To go DOWN in menus
Р	To go UP in menus
Q	On/Off: power the unit
U	TIMECLOCK: shows timeclock on/off
R	FAULT: shows error alarm, refer to error codes
X	HEATER: Shows heater output is active

When powered in auto mode, the CTRL-DSP displays as follows in figure 1 (Auto mode refers to applications 0-10V, Pressure,  $CO_2$ , RH and Temperature)

When powered in manual mode, the CTRL-DSP displays as follows in figure 2 (Manual mode refers to application Manual)

### Main Menu on CTRL-DSP

4

To enter the main menu press  $\mathsf{OK}$  or  $\mathsf{ESC}$  To exit the main menu press  $\mathsf{ESC}$  or wait approx.  $\mathsf{60}$  seconds

The recommended cable to wire between the DCV controller and the CTRL-DSP display is 4 pole, twisted paired, communication cable.

The maximum cable distance for the CTRL-DSP display is 30 meters.

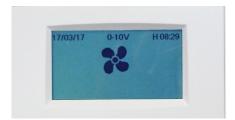

figure 1

figure 2

### Display Functions

#### **Display Functions / Main Menu Functions**

	Use ▲ or ▼ to select required menu
Main Menu	Press OK to enter any parameter
	*P02 to P04 only visible in selected applications 0-10V, Pressure, CO <sub>2</sub> , RH and Temperature
	Allows selection of language between English and Italian
	Press OK to enter
Language	Language is flashing: Use ▲ or ▼ to choose
	Press OK to select
	*The factory setting (DEFAULT) is English
	Allows selection of date and time
	Press OK to enter
Date/Time	Use▲ or ▼ to choose
	Press OK for setting and again to confirm
	Press ESC to go back to the previous menu
	Allows selection of Fan Mode
	Press OK to enter
	Fan mode is flashing: Use ▲ or ▼ to choose
P00: Fan Mode	Press OK to select
	*The factory setting (DEFAULT) is SINGLE for single fans and TWIN for twin fans
	**Refer to Fan Mode Control Functions
	Allows selection of desired Application
	Press OK to enter
	Application is flashing: Use ▲ or ▼ to choose
	Applications available:
	0-10V: input signal 0-10 VDC determines the fans speed 0-100% of the configured max. Speed. High input signal gives high fan speed
	MANUAL: The fan speed is set manually using the CTRL-DSP's UP and DOWN buttons
	PRESSURE: Duct air pressure (Control input signal 0-10VDC mapped to pressure sensor range) is controlled by a PID controller (Proportional, Integrating and
	Derivating). High pressure value gives low fan speed
P01: Application	RH: The room relative humidity (control input signal 0-10 VDC mapped to RH sensor range) is controlled by a P controller (P band). High relative humidity gives high
	fan speed.
	CO <sub>2</sub> : The room's CO <sub>2</sub> content (Control input signal 0-10 VDC mapped to CO <sub>2</sub> sensor range) is controlled by a P controller (P band). High CO <sub>2</sub> rate gives high fan speed.
	TEMPERATURE: The room temperature (control input signal 0-10 VDC mapped to Temperature sensor range, or T11 input, depending on the value of P12
	parameter) is controlled by a P controller
	(P band). High temperature gives high fan speed.
	Press OK to select
	*The factory setting (DEFAULT) is 0-10V
	**Refer to Application Control Functions for further information
	того с дравиот сотвот иниота от пинистрание

Press ESC to go back to the previous menu  Allows to load the saved setting on the next unit  Press OK to enter.	of the CTRL-DSP	00:00 The Data is saved both on the CTRL-DSP and the PCB to be loaded afterwards in other units.			
	O0:00  Provides a count of number of unit working hours. This value can be press OK to enter  Press OK to enter  Press OK / ESC to return to main menu  Allows to save the setting of parameters in the internal memory  Press OK to enter.  Use ▲ or ▼ to choose the position where to save the setting. Use to be pressed to confirm.  Press OK to confirm.  Press ESC to go back to the previous menu  Allows to load the saved setting on the next unit  Press OK to enter.  Use ▲ or ▼ to choose the desired saved setting	of the CTRL-DSP	00:00 The Data is saved both on the CTRL-DSP and the PCB to be loaded afterwards in other units.			
Save Settings	O0:00  Provides a count of number of unit working hours. This value of the press OK to enter  Press OK to enter  Press OK / ESC to return to main menu  Allows to save the setting of parameters in the internal memory  Press OK to enter.  Use ▲ or ▼ to choose the position where to save the setting. The press OK to select.  Press OK to confirm.  Press ESC to go back to the previous menu  Allows to load the saved setting on the next unit  Press OK to enter.  Use ▲ or ▼ to choose the desired saved setting  Press OK to select.	of the CTRL-DSP	00:00 The Data is saved both on the CTRL-DSP and the PCB to be loaded afterwards in other units.			
Save Settings	O0:00  Provides a count of number of unit working hours. This value can be press OK to enter  Press OK to enter  Press OK / ESC to return to main menu  Allows to save the setting of parameters in the internal memory  Press OK to enter.  Use ▲ or ▼ to choose the position where to save the setting. Use to be pressed to confirm.  Press OK to confirm.  Press ESC to go back to the previous menu  Allows to load the saved setting on the next unit  Press OK to enter.  Use ▲ or ▼ to choose the desired saved setting	of the CTRL-DSP	00:00 The Data is saved both on the CTRL-DSP and the PCB to be loaded afterwards in other units.			

### Display Functions

	Allows restoring all the factory settings (DEFAULT).
Restore Default Settings	Press OK to enter.
	Press OK to confirm.
	Allows you to set the LCD contrast.
Contrast	Use ▲ or ▼ to increase or decrease the contrast.
	Press OK to confirm.
	Shows the internal functional parameters of the unit.
Debug Page	Press OK to enter.
	Press ESC to go back to the previous menu.

#### **Service Menu Functions**

	Service Menu on CTRL-DSP						
Service Menu	To enter the service menu, change P01 to anything other than MANUAL, then from the main screen press and hold OK for 3 seconds						
Sel vice Meliu		, ,	NOAL, their from the main scree	in press and hold Ork for a second	10		
	To exit to the main screen, press						
	Shows values for each parameter	er					
S00: Parameter summary	Use ▲ or ▼to view parameters						
	Press ESC to go back to the pre	evious menu.					
	Allows selection of the motor pro	otection method (FACTORY SET)					
	Press OK to enter						
	Value is flashing: Use ▲ or ▼ to	choose					
S01: Fan status signal	Press OK to select						
	Available settings are						
	TACHO The fan(s) has a tacho output (open collector hall effect sensor) connected to RPM-GND. The running status is indicated by the presence of the RPM signal						
	RELAY The fan(s) has a relay output (closed when fan is running) connected to RPM-GND. The running status is indicated by a closed link between RPM and GND						
	Allows adjustment of the global gain for applications to be fine-tuned/ adjusted beyond P05						
	Press OK to enter						
	Value is flashing: Use ▲ or ▼ to choose						
	Press OK to select						
	*Any change from default setting will drive P05 to CUSTOM						
S02: Global Gain	Available settings are						
	P05 Original Setting	Default	Min	Max	Min Value Change		
	Slow	0.2	0.1	1	0.1		
	Normal	0.5	0.1	1	0.1		
	Fast	0.9	0.1	1	0.1		

### Display Functions

Allows adjustment of the proportional band for applications to be fine-tuned/ adjusted beyond P05									
	Press OK to enter								
	Value is flashing: Use ▲ or ▼ to choose								
	Press OK to select								
	*Any change from default	setting will drive P05 to CUS	STOM						
	Available settings are								
603: Proportional Band				T					
	Application	Default	Min	Max	Min Value Change	Unit/Value			
	0-10V	0.1	1	1	0.1	1			
	Temperature	0.1	1	1	0.1	1			
	CO <sub>2</sub>	0.1	1	1	0.1	1			
	RH	0.1	1	1	0.1	1			
	Pressure	0.1	1	1	0.1	1			
	Parameter is only visible w	hen application is PRESSUI	RE						
	Allows adjustment of the in	ntegration time for application	ons to be fine-tuned/ adjuste	ed beyond P05					
	Press OK to enter	Press OK to enter							
	Value is flashing: Use ▲ o	Value is flashing: Use ▲ or ▼ to choose							
S04: Integration Time	Press OK to select								
	*Any change from default setting will drive P05 to CUSTOM								
	Available settings are								
	Application	Default	Min	Max	Min Value Change	Unit/Value			
	Pressure	10	5	500	5	seconds			
	Parameter is only visible w	Parameter is only visible when application is PRESSURE							
	Allows adjustment of the derivation time for applications to be fine-tuned/ adjusted beyond P05								
	Press OK to enter								
	Value is flashing: Use ▲ or ▼ to choose								
S05: Derivation Time	Press OK to select	Press OK to select							
	*Any change from default setting will drive P05 to CUSTOM								
	Available settings are								
	Application	Default	Min	Max	Min Value Change	Unit/Value			
	Pressure	0	0	500	10	seconds			
	Shows the internal function	nal parameters of the unit.	ı	ı					
Debug Page	Press OK to enter.								
	Press ESC to go back to t	he previous menu.							
	Shows the internal control								
	Press OK to enter.								
	Press ESC to go back to t	he previous menu.							
	Selected application	(e.g. temperature)							
Control Debug Page	Setpoint	(e.g. 20°C)							
	Measured Parameter	(e.g. 17.9°C)							
			ntroller, calculated from Glo	oal Gain and Proportional R	and parameters (service m	nenu)			
	Proportional gain Kp A parameter of the PID controller, calculated from Global Gain and Proportional Band parameters (service menu)  Integral gain Ki A parameter of the PID controller (used only in Pressure application), calculated from Kp and Integration Time (service menu)								
	Integral gain Ki	A parameter of the PID co.	ntroller (used only in Pressu	e application) calculated fr	om Kn and Integration Tim	e (service menu)			

### Control Functions

#### **Control Functions**

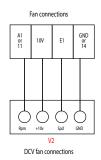

Fans will run alternatively, changing duty every 6th hour. If there's a fan failure, only the "surviving" fan is run and an error message is displayed. The duty switch can be manually forced by pressing the LEFT or RIGHT button for 5s

Two independent fans used for twin fan applications (one fan must be DCV)

### Single Fan

### Pre-wired DCV single fan

Second EC

Fans will run alternatively, changing duty every 6th hour. If there' a fan failure, only the "surviving" fan is run and an error message is displayed. The duty switch can be manually forced by pressing the LEFT or RIGHT button for 5s.

### Master/Slave Fans

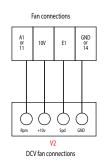

Fan 2 (SLAVE) speed control is equivalent to Fan 1 (MASTER) speed control (each one relative to their limits, set by parameters) (one fan must be DCV)

### Pre-wired DCV single fan

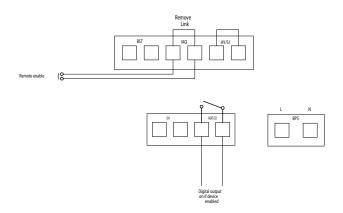

### Pre-wired DCV single fan

### Control Functions

### Remote ON/OFF (Device Enabled)

The fan controller will be enabled if the digital input REMOTE ENABLE (IAQ) is active (contact closed). This is indicated by digital output DEVICE ENABLED (HEAT/CD) = ON.

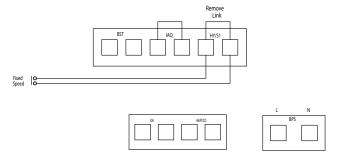

#### **Internal Timeclock enable**

It is possible to operate the on / off function by the weekly timer (parameter setting "weekly timer"). This allows up to four on and four off settings per day. Fan operation in conjunction with remote enable (terminal IAQ) is shown below.

IAQ Terminals	Weekly Timer (on/off times set)	Fan On / Off	Device Enabled Output
OPEN	ON	ON	ON
OPEN	OFF	OFF	OFF
CLOSED	ON	ON	ON
CLOSED	OFF	ON	ON

#### **Fixed Speed**

When the device is enabled and the HY/S1 input is open, the unit runs at a fixed speed set by the P06 parameter (relative to speed limits)

### Trickle / Boost (using Fixed Speed function)

By setting parameter P06 (fixed speed) to 100% and P09 (max fan speed) set to 100% it is possible to have a trickle speed (defined by sensor output in Non-manual application or the manual set speed in Manual application) and a boost speed by opening connections HY/S1(fixed speed)

HY/S1 Terminals	Application (P01)	TRICKLE/BOOST	VALUE
OPEN	0-10V/ PRESSURE/RH/TEMPERATURE	BOOST	P06/P09
CLOSED	0-10V/PRESSURE/RH/TEMPERATURE	TRICKLE	SENSOR OUTPUT
OPEN	MANUAL	BOOST	P06/P09
CLOSED	MANUAL	ON	MANUAL SETTING

### Control Functions

#### 0-10V/PRESSURE/RH/TEMPERATURE

Application With trickle speed defined by sensor output rather than a fixed value, the ventilation is guaranteed by the requirements of the sensor, e.g. if CO<sub>2</sub> sensor detects levels above the desired set point then the sensor will call for a higher trickle speed as CO<sub>2</sub> levels have been detected that require ventilation at a higher speed

#### MANUAL Application

The trickle speed is defined by the value manually set using the CTRL-DSP  $\blacktriangle$  or  $\blacktriangledown$  buttons

#### Night Set Back (using Fixed Speed function)

By setting parameter P06 (fixed speed) to 20% and P08 (min fan speed) set to 20% it is possible to have a night set back by opening connections HY/S1 (fixed speed).

HY/S1 Terminals	Application (P01)	Night Set Back (NSB)/Normal	VALUE
OPEN	0-10V/PRESSURE/RH/TEMPERATURE	NSB	P06/P08
CLOSED	0-10V/PRESSURE/RH/TEMPERATURE	NORMAL	SENSOR OUTPUT
OPEN	MANUAL	NSB	P06/P08
CLOSED	MANUAL	NORMAL	MANUAL SETTING

#### 0-10V/PRESSURE/RH/TEMPERATURE Application

Night Set Back is defined by the status of connections HY/S1, when open the fan speed is defined by parameters P06 and P08 When connections HY/S1 are closed, the speed defined by sensor output rather than a fixed value, the ventilation is guaranteed by the requirements of the sensor, e.g. if  $\mathrm{CO}_2$  sensor detects levels below the desired set point then the sensor will call for a lower speed as  $\mathrm{CO}_2$  levels have been detected that require ventilation to be less, this ensure that over ventilation is not experienced.

### MANUAL Application

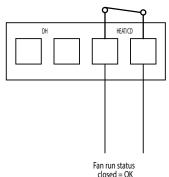

The NORMAL operating speed is defined by the value manually set using the CTRL-DSP  $\blacktriangle$  or  $\blacktriangledown$  buttons

#### **Fan Status**

If fans are OK (no failure), this is indicated by digital output FAN RUN STATUS (DH) = ON.

#### **Heater Fan Over run**

Run on time is required to allow heat dissipation if the heater output is ON in Temperature application (or OFF if less than 3 minutes) with internal time clock in an OFF mode and the remote enable input is off; run on time is adjustable via a dedicated parameter (min. 3 minutes).

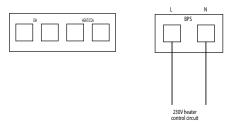

### Control Functions

### **Heater Output**

In temperature mode, if the measured sensor temperature falls below the set point, the output BPS provides a 240V output to switch a heater control circuit

#### **Fault Diagnostics**

In the event of a fault, Exx error code shows on user display. Error description

E000	no connection between CTRL-DSP and PCB
E001	FAN 1 fault
E002	FAN 2 fault
E003	T11 fault (only possible if P12 = T11)
E004	(spare)
E005	(spare)
E006	(spare)
E007	(spare)
E008	CTRL-DSP internal clock error

#### **Applications**

The controller software is designed to handle 6 different Applications. Each application has its own set of parameters (input value range, setpoints, p band, etc.) and control function. The application is preselected at factory but can be changed in field as other parameters using

the CTRL-DSP.

When the device is enabled, the fan speeds are controlled by the value of the CONTROL INPUT SIGNAL, depending on the application.

### 0-10V Control

Control input signal 0-10 VDC determines the fans speed 0-100% of configured max. Speed. High input signal gives high fan speed.

Where:

$$\Delta \text{ speed [\%]} = \frac{40 \text{ * Global Gain}}{\text{Prop.Band (0+10V)}} \text{*error}$$

$$\text{error} = V_{\text{measured}} - V_{\text{setpoint}}$$

### Control Functions

#### **Temperature**

The room temperature (control input signal 0-10 VDC via Temperature, or pre-fitted T11 input, depending on the value of P12 parameter) is controlled by P band. High temperature gives high fan speed.

Where:

$$\Delta$$
 speed [%] =  $\frac{40 * \text{Global Gain}}{\text{Prop.Band (Temperature)}}$  \*error

#### CO<sub>2</sub>

The room's CO2 content (Control input signal 0-10 VDC via CO2 sensor) is controlled by P band. High CO2 rate gives high fan speed.

Where:

$$\Delta \; \text{speed [\%]} = \; \frac{40 \; \text{* Global Gain}}{\text{Prop.Band (CO}_2)} \; \text{*error}$$

$$error = CO_{2 \text{ measured}} - CO_{2 \text{ set point}}$$

#### **Relative Humidity**

The room relative humidity (control input signal 0-10 VDC via RH sensor) is controlled by P band. High relative humidity gives high fan speed.

Where:

$$\Delta$$
 speed [%] = 40 \* Global Gain Prop.Band (RH) \*error

#### Pressure

Duct air pressure (Control input signal 0-10VDC via pressure sensor) is controlled by a PID controller (Proportional, Integrating and Derivating). High pressure value gives low fan speed

$$\Delta \text{ speed [\%]} = - \frac{2 * \text{ Global Gain}}{\text{Prop.Band (pressure)}}$$

$$* \begin{bmatrix} \text{error * dt} & \text{+ Derivation *} & \frac{\text{d(P}_{\text{measured}})}{\text{Integration Time}} \end{bmatrix}$$

In the main menu, the user can choose between different PID CONTROL settings:

Normal: the S02 (Global Gain) parameter is set to 0.5, other PID values to default Slow: the S02 (Global Gain) parameter is set to 0.2, other PID values to default Fast: the S02 (Global Gain) parameter is set to 0.9, other PID values to default

For the advanced users and/or feedback fine tuning, it is possible to adjust the parameters S02 to S05 manually in the SERVICE MENU. After a modification of one of the above parameters in the SERVICE MENU, the P05 PID CONTROL parameter is automatically set to CUSTOM.

#### Manual

The fan speed is set manually using the CTRL-DSP's UP and DOWN buttons (adjustment increments of 1%).
